Touch Upgrade V5

A complete upgrade solution for customers operating machines with the old computer platform who want to transition to a modern, serviceable, and future-supported control environment. The old platform was implemented between 2002 and 2016. As development has shifted to the V5 environment, the old platform now has functional and support limitations compared with the current system.

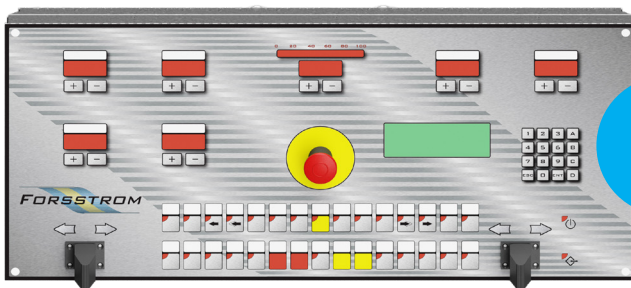

Why Customers Upgrade

Machines running an older computer can continue to operate reliably. However, the platform is based on an earlier software architecture. For companies focused on long-term operation, serviceability, and usability, remaining on the old platform introduces constraints that can be avoided with an upgrade.

Key Customer Benefits

- Upgrade to the current V5 Touch platform
- Stronger foundation for long-term service and support
- Fewer limitations compared to old system
- Improved and more intuitive operator experience
- A practical way to extend the productive life of your machine

V5

Why Upgrade Now

Upgrading to V5 aligns your machine with Forsstrom's current control platform. It improves long-term maintainability, simplifies service, and ensures your equipment remains compatible with the systems and support structure used across new Forsstrom machines.

Next Step

Contact Forsstrom to verify compatibility and receive a quotation for Touch Upgrade V5. Our team will guide you through a straightforward transition from old platform to V5.
